Martel Paper - Daily OA Pain

2024-03-18

Data Wrangling

```
## Load packages
library(tidyverse)
library(ggplot2)
library(tidyr)
library(haven)## This library provides functions to read sav file into R
library(lme4)
library(lmerTest)
```

```
## Read data
data_paper <- read_sav("Dataset; 2024.1.sav")
checkdf3 <- data_paper |>
  subset(ID == 2072) |>
  select(c(ID,
           Level1_Even_DateIn,
           Level1_Even_TimeIn))
```

Adjusting Wave Day

- DT_i combines D_i and T_i: 'DateTime' variable
- DT_0 is the first response 'DateTime' for each patient
- W_i is the adjusted 'Wave_Day' variable
- Add a grace period G for calculating the adjusted W_i, in our case $G = 6$ hours
- Calculate the datetime difference H_i in **hours** from the first response, incorporating the grace period:

$$H_i = DT_i - DT_{i-1}$$

- Then apply the grace period indicator I_i:

$$I_i = \begin{cases} 1 & \text{if } H_i \leq 24 + G \\ \left\lceil \frac{H_i - G}{24} \right\rceil & \text{otherwise} \end{cases}$$

- The initial response for 'Wave_Day' is 1, i.e., $W_0 = 1$, then the adjusted 'Wave_Day' W_i is

$$W_i = \sum_{i=0}^{i-1} I_i$$

```
## Consecutive Days - Grace Period 6 hours
data_paper <- data_paper |>
  mutate(Lev1_DateTimeIn = as.POSIXct(strptime(paste(Level1_Even_DateIn,
                                                     Level1_Even_TimeIn),
                                               format="%Y-%m-%d %H:%M:"))) |>

###### Check if lagged value is correct ######
data_paper2_check <- data_paper2 |>
  select(c(ID, Wave_Day_Adjusted, IndexLev1_PainAverage, IndexLev1_PainAverage_Lagged))
```

$$APE(t_i) = I(PAIN(t_i) - PAIN(t_i - 1) \geq 20)$$

```
## APE index
data_paper2 <- data_paper2 |>
  group_by(ID) |>
  mutate(APE = ifelse(IndexLev1_PainAverage - IndexLev1_PainAverage_Lagged >= 20, 1, 0))

###### Check if it is correctly coded ######
data_paper2_check <- data_paper2 |>
  select(c(ID, Wave_Day_Adjusted, IndexLev1_PainAverage, IndexLev1_PainAverage_Lagged, A
```

For calculating the RPE based on the within person mean, define the indicator that the pain is above the average pain for person i on day t_i.

$$A(t_i) = I(PAIN(t_i) > \frac{1}{n_t}\sum_{t=1}^{n_i} PAIN(t_i))$$

Then define the RPE given $A(t_i) = 1$ for person i on day t_i.

$$RPE(t_i) = I\Big([PAIN(t_i) \leq \frac{1}{n_t}\sum_{t=1}^{n_i} PAIN(t_i)]|A(t_i - 1)\Big)$$

```
## RPE Index using within person mean
data_paper2 <- data_paper2 |>
  group_by(ID) |>
  mutate(AVE = mean(IndexLev1_PainAverage, na.rm = TRUE),
         A = ifelse(IndexLev1_PainAverage > AVE, 1, 0),
         A_lag = lag(A),
         Lev1_RPE_useMean = ifelse(A_lag == 1,
                                   ifelse(IndexLev1_PainAverage <= AVE, 1, 0), 0))

###### Check ######
data_paper2_check <- data_paper2 |>
  select(c(ID, Wave_Day_Adjusted, IndexLev1_PainAverage, IndexLev1_PainAverage_Lagged,
           AVE, A, A_lag, Lev1_RPE_useMean))
# 203 RPEs
```

For calculating the RPE based on the APE,

$$RPE(t_i) = I\Big([PAIN(t_i) \leq \frac{1}{n_t}\sum_{t=1}^{n_i} PAIN(t_i)]|APE(t_i - 1)\Big)$$

```
## RPE Index using APE
data_paper2 <- data_paper2 |>
  group_by(ID) |>
  mutate(APE_lag = lag(APE),
         Lev1_RPE_useAPE = ifelse(APE_lag == 1,
                                   ifelse(IndexLev1_PainAverage <= 20, 1, 0), 0))

###### Check ######
data_paper2_check <- data_paper2 |>
  select(c(ID, Wave_Day_Adjusted, IndexLev1_PainAverage, IndexLev1_PainAverage_Lagged,
           APE, APE_lag, Lev1_RPE_useAPE))
# 4 RPEs
```
